

# Unanet Cloud

A Secure, Reliable, and Scalable Solution to Maximize Growth

Many companies are still using on-premise services for their data storage, despite experiencing challenges that can greatly impact both business operations and confidential data security. This can be solved by switching to cloud-based storage, which removes the most prevalent issues faced by most businesses.

## Security

When keeping data within an on-premise system, making sure it is secure is tricky. Storing documents and invoices can be complicated since it requires keeping a close eye on hard drives and backups, and often these systems do not allow for global access. Cloud-based storage simplifies uploads, backs up data minute-by-minute and prevents the need to worry about hard-drive space. It also offers on-demand database exports and has 24/7 global access built in.

## Cost to Switch

Organizations often are concerned about costs involved in making the switch from on-premise to cloud-based data storage, but the reality is that there are many ways in which the move to the cloud actually offers cost savings. Having to consider things like servers, databases and upgrades can add up while also requiring valuable time and resources; the cloud eliminates these issues.

## Data Control

In our current and future environment of remote connecting, things like VPNs and other barriers can impede a business's ability to seamlessly access time and expense sheets and other documents. By moving to the cloud, businesses have 24/7 web and mobile global access, automatic backups, and replicated data across drives, servers and data centers in different geographic regions.

### Over 1,500 customers are enjoying the benefits of our cloud solutions

The Unanet Cloud platform allows customers to support their information technology needs in a scalable way. Our Cloud platform is built on tried-and-true world-class cloud technologies. To learn more about Unanet's cloud-based data solutions, [contact your CSM](#).
